In computer programming, an entry point is where the first instructions in a program are executed, and where the program has access to command line arguments.. To start a program's execution, the loader or operating system passes control to its entry point. (During booting, the operating system itself is the program).This marks the transition from load time (and dynamic link time, if present ...

Variable named digits is defined using the while processor, producing sequence of 9 values. Next, the regexr processor is invoked in order to do search-replace on variable value. text processor is used to concatenate all digit values into single one. Without text processor, regular expression search would be applied to each item in the list (every digit) and that way no replace would occur ...
